Liquid Level Sensor Type AKS 4100/4100U

Features

- Approved and qualified by Danfoss for refrigeration applications
- One product covering several probe lengths (cable version)
- A single product for all commonly used refrigerants (cable version)
- Cable version requires less top-end clearance for installation and service
- Proven operation with all refrigerants in combination with oil.
- No need to clean cable version when fully covered by oil.
- The cable version is very compact and easy to handle, ship, install and use with different lengths and refrigerants
- Changes of the liquid dielectric constant (εr) do not affect operation.

The AKS 4100/4100U liquid level sensor is designed specifically to measure liquid levels in a wide range of refrigeration applications.

The AKS 4100/4100U liquid level sensor is based on a proven techhology called Time Domain Reflectometry (TDR) or Guided Micro Wave.

AKS 4100/4100U liquid level sensor can be used to measure the liquid level of many different refrigerants in vessels, accumulators, receivers, standpipes, etc.

The electrical output is a 2-wired, loop powered 4 – 20 mA output signal, which is proportional to the refrigerant liquid level.

AKS 4100/4100U in a cable version is suitable for HCFC, Non flammable HFC and R717 (Ammonia), and differing lengths from 800 mm / 31.5 in. and up to 5000 mm / 197 in..

The coaxial version of AKS 4100/4100U is designed for use with R744 (CO₂), HCFC, Non flammable HFC and R717 (Ammonia).

The AKS 4100/4100U coaxial version should always be used for marine applications for all refrigerant types.

The AKS 4100/4100U cable version should NOT be used for CO_2 or marine applications.

Dust, foam, vapour, agitated surfaces, boiling surfaces, changes in density or in the dielectric constant, ϵ r, for the liquid have no influence on the AKS 4100/4100U performance.

Oil accumulated in the bottom of a standpipe will not disturb the liquid level signal and it is not necessary to remove AKS 4100/4100U for cleaning after oil has been drained out of the standpipe.

- 5000 mm / 197 in. probe length with cable version
- 2-wire loop powered; no separate transformer needed.

Please Note:

AKS 4100/4100U can be connected directly to Danfoss EKE 347 liquid level controller and thus be powered from EKE 347.

If used together with Danfoss EKC 347 liquid level controller, a 14 – 30 V DC supply is required.

 Multi language HMI. Level and setting readout in mm,cm,m (ft, in.)

Language HMI versions:

- English (default), German, French, Spanish
- English (default), Japanese, Chinese Russian

For further details regarding mechanical and electrical installation please refer to the product installation guides DKRCI.PI.SC0.D (CABLE version), DKRCI.PI.SC0.E (COAXIAL D14 version) and DKRCI.PI.SC0.H1/DKRCI.PI.SC0.J1 (COAXIAL D22 version).

The service unit supports mulitple languages in both SI and US units.

Measuring principle (Cable and Coaxial)

The AKS 4100/4100U electronic converter emits lowintensity, high frequency electromagnetic pulses with a width of approximately 1 nanosecond, which travel at the speed of light along the probe (wire or coaxial cable) down to the liquid surface.

The pulses are reflected by the liquid surface, guided back along the probe, and received and analysed by the AKS 4100/4100U electronic converter and then converted into a liquid level reading. This method is called time domain reflectometry (TDR) or guided microwave.

The dielectric constant, εr , of the liquid is a key parameter and has a direct impact on the degree of reflection of the high frequency electromagnetic pulses. Liquids with high εr values, such as ammonia, produce strong reflections, while liquids with low εr values, such as CO₂, produce weak reflections. As long as the ϵ r value of the liquid refrigerant is higher than 1.2, AKS 4100/4100U can detect the liquid level and level measurement accuracy is not affected.

If the temperature condition in the standpipe / vessel is known, a constant (dielectric constant of the refrigerant gas) can be entered (parameter 2.5.3 GAS EPS.R), in order to obtain improved Top and Bottom Dead Zone values.

Refer to pages 7 to 8 for Measuring range of AKS 4100/4100U - CABLE version and COAXIAL version.

For details of gas constant values for different temperatures and refrigerants plus the procedure for entering these via the HMI, refer to pages 16 to 17.

Optional Procedure

If the temperature condition in the stand pipe is known, a constant (dielectric constant of the refrigerant gas) **can be** entered (parameter 2.5.3 GAS EPS.R), in order to obtain lower Top and Bottom Dead Zone values **(see pages 7 and 8)**. Entering refrigerant dielectric gas constant (all values below are only examples)
